Canadian Bioinformatics Workshops

Module #1b: Application Scenarios

Dr. Erin Pleasance

CBW High-Throughput Genomics

November 4-6, 2026

CANADA'S MICHAEL SMITH GENOME SCIENCES CENTRE

Scenarios

- We will go through a few example scenarios and discuss what approaches might be relevant
- You will be discussing in groups of 3-4 people
- The slide deck we go through will be posted at the end of today's workshop

Introductions (10 mins)

- Find a group of 3-4 people
- Introduce yourself and your research background/interests
- Share with your group: What is something you learned or found interesting so far today?

Scenario 1: Pneumonia outbreak

- Several hospitals have reported patients admitted with severe pneumonia
- We have samples from their respiratory tract
- We want to know what is causing the pneumonia and whether these outbreaks are related

Wikipedia.org

Scenario 1: Pneumonia outbreak

- Several hospitals have reported patients admitted with severe pneumonia
- We have samples from their respiratory tract
- We want to know what is causing the pneumonia and whether these outbreaks are related

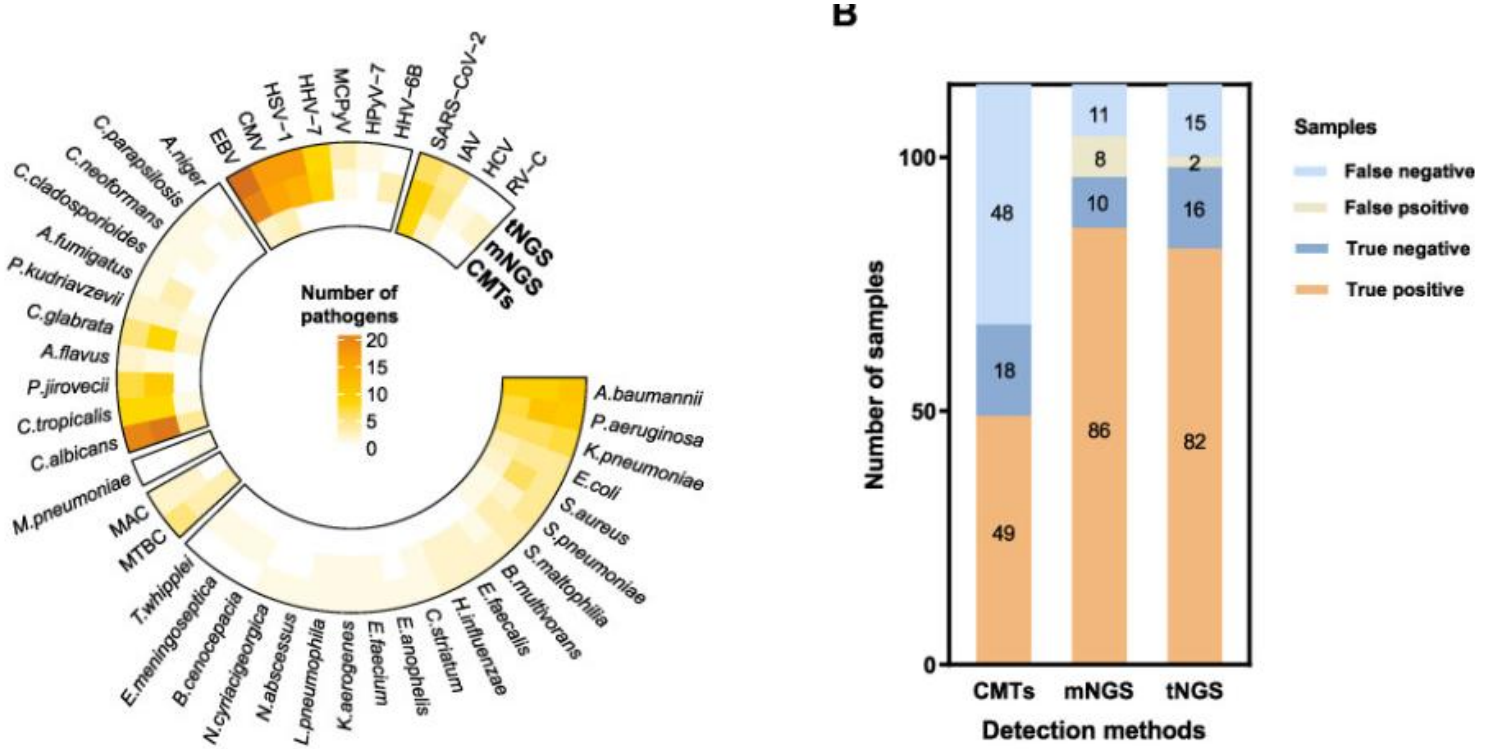

Wikipedia.org

Discuss:

- What kind of sequencing approaches might be useful?
- What would be the benefits or limitations of these approaches?

Scenario 1: Pneumonia outbreak

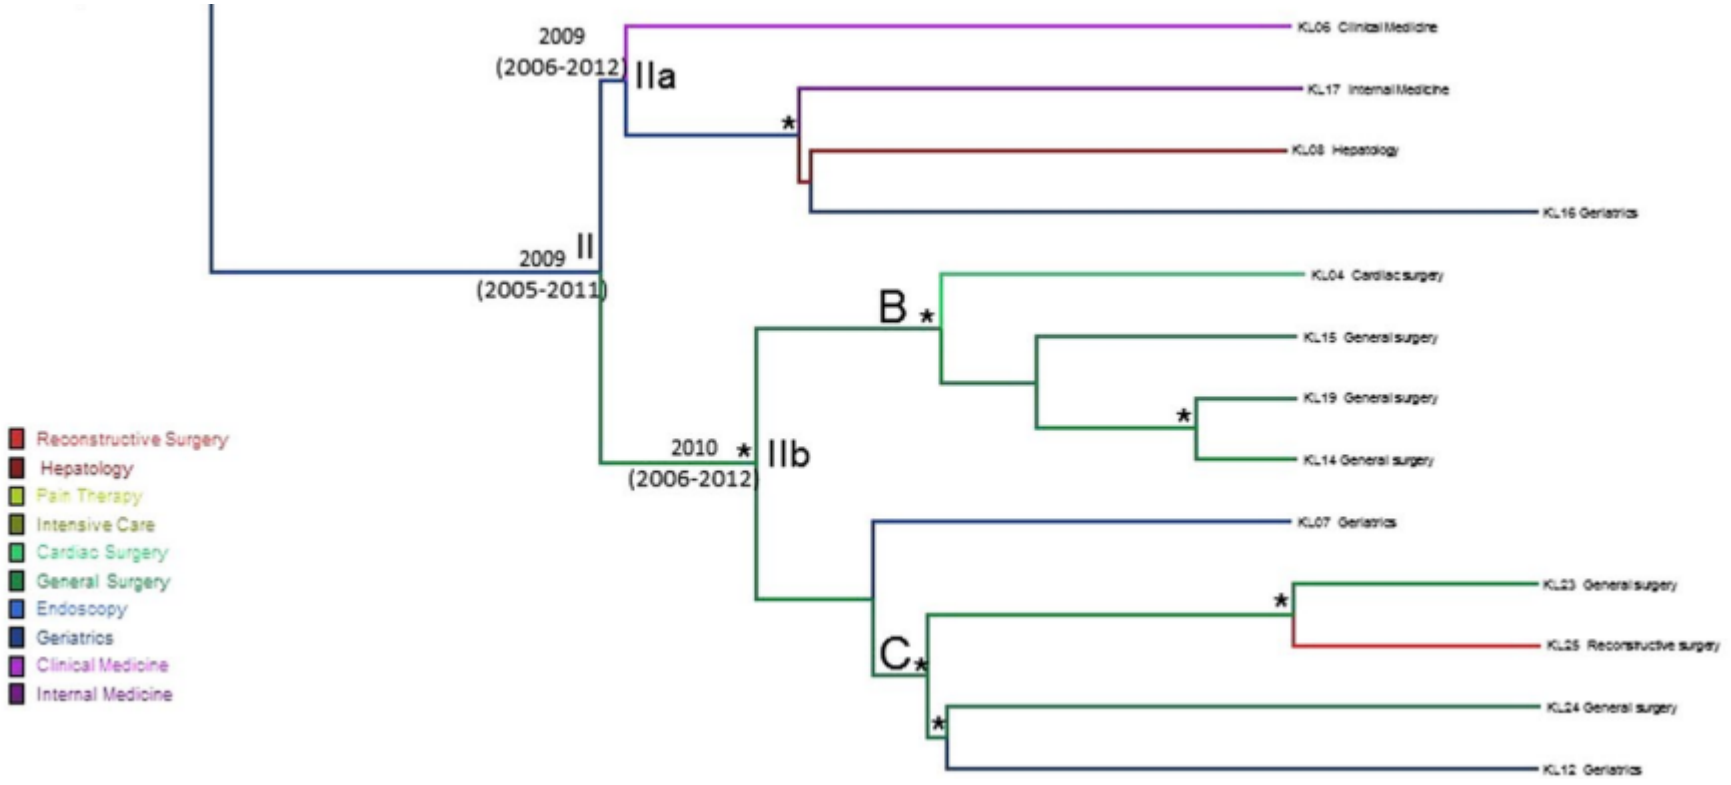

- Targeted vs. metagenomic: Cost, complexity, comprehensiveness

PMID: 39872133

Scenario 1: Pneumonia outbreak

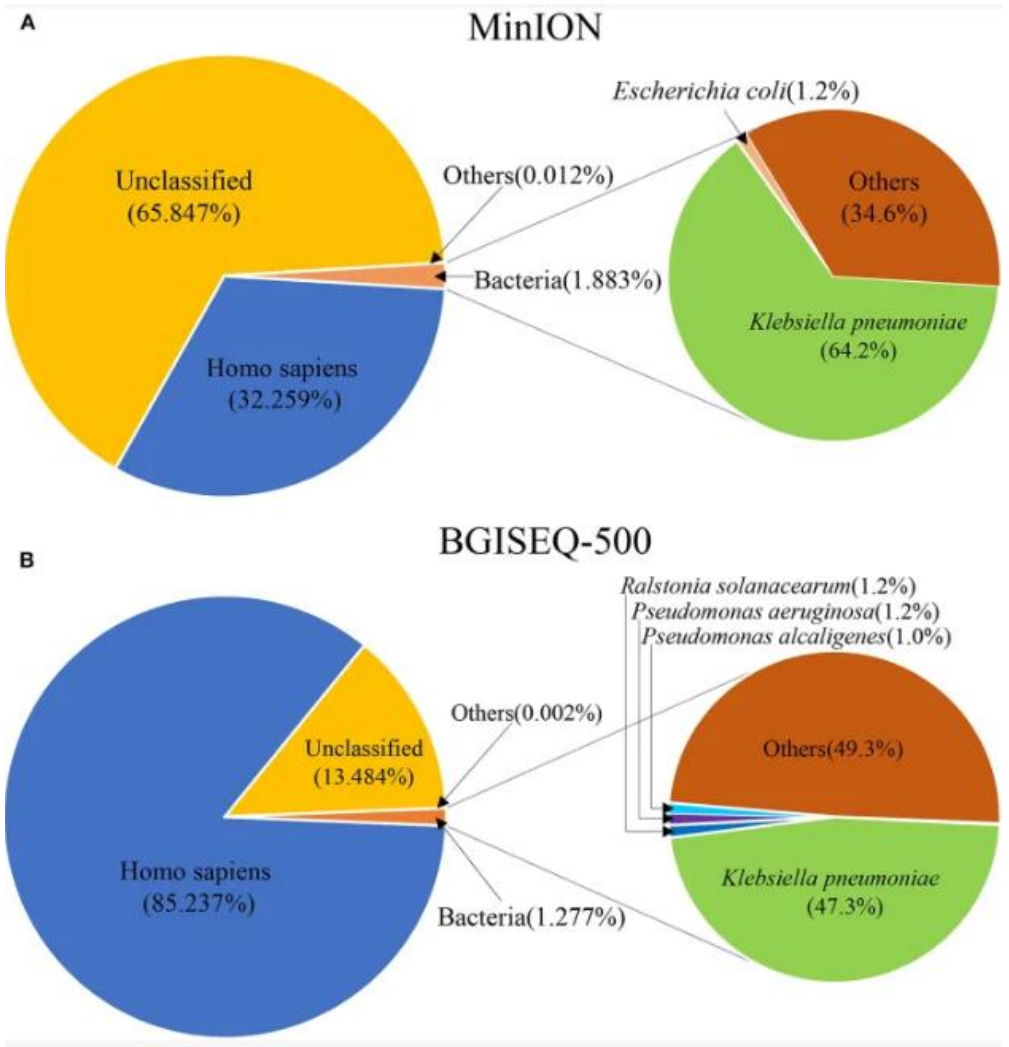

- Targeted vs. metagenomic: Phylogeny and drug resistance

PMID: 28615687

Scenario 1: Pneumonia outbreak

- Long vs short read: Time and accuracy

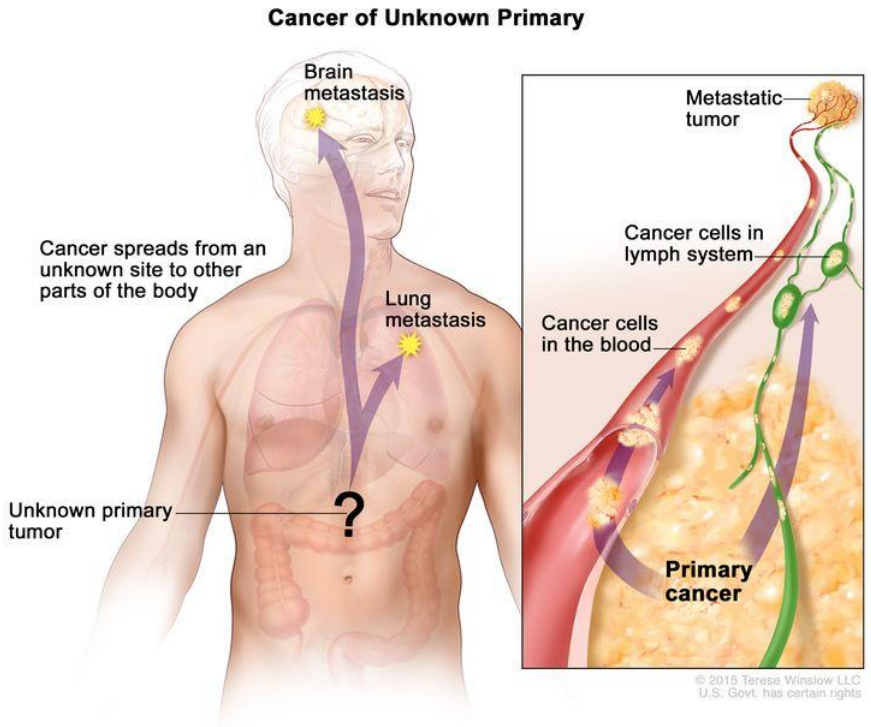

"It took ~1 min from beginning of sequencing to obtain the first specific reads of K. pneumoniae by MinION ... resistance genes including blaSHV-12, aac(3)-IIa and blaKPC-2 were detected within one and a half hours"

PMID: 32432051

Scenario 2: Unknown cancer

- A patient has a cancer of unknown origin with unclear pathology
- We have a sample of the tumour from the lung and of the patient's normal blood
- We want to know what type of cancer it is and how it might be treated

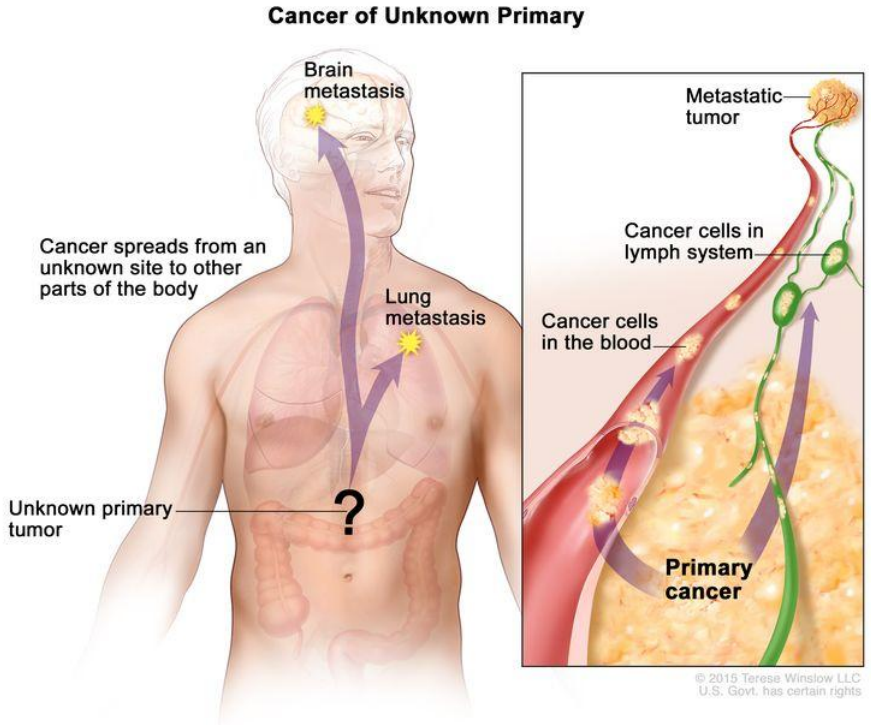

www.cancer.gov/types/unknown-primary/patient/unknown-primary-treatment-pdq

Scenario 2: Unknown cancer

- A patient has a cancer of unknown origin with unclear pathology
- We have a sample of the tumour from the lung and of the patient's normal blood
- We want to know what type of cancer it is and how it might be treated

Discuss:

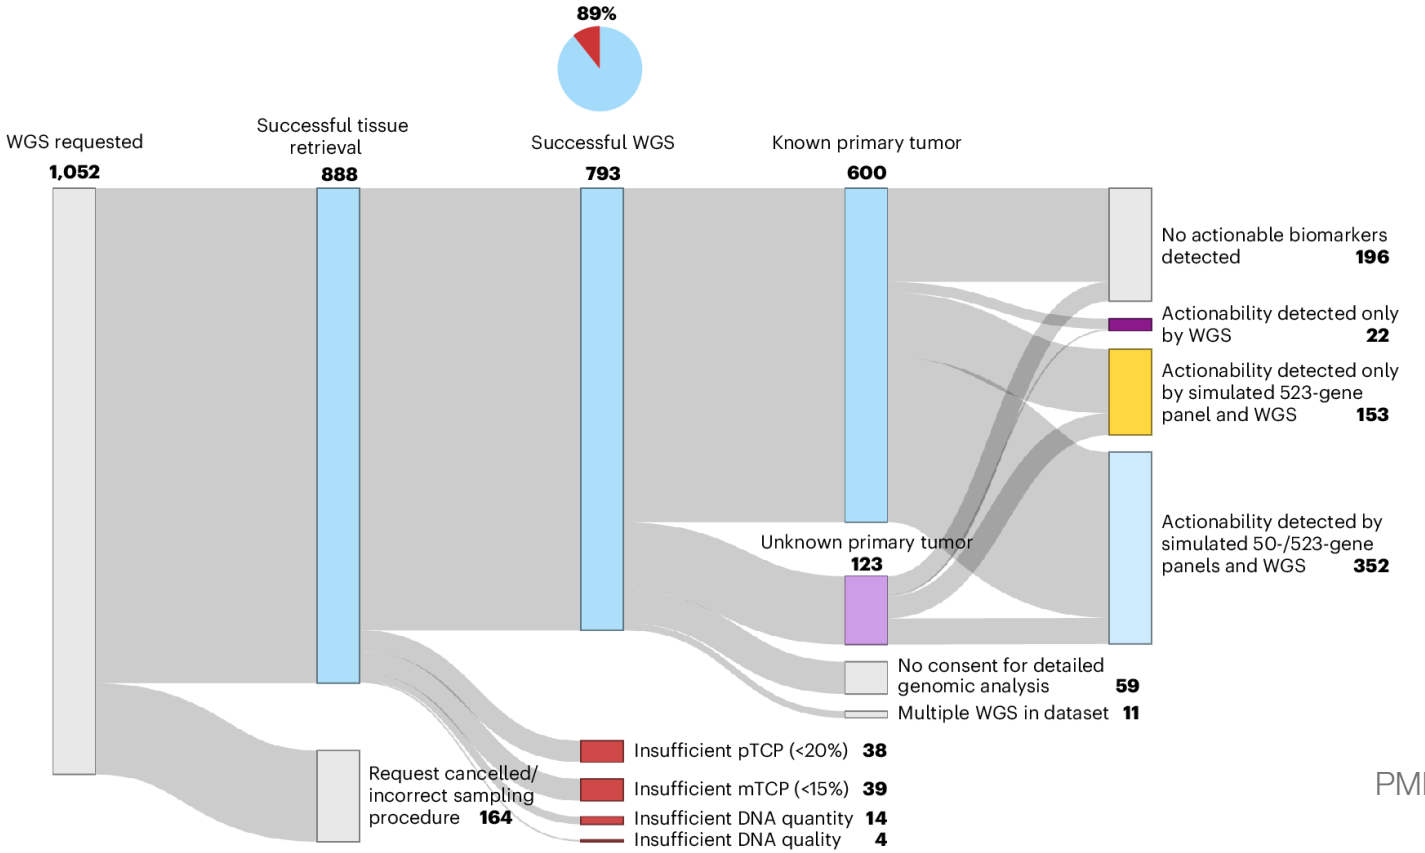

- What kind of sequencing approaches might be useful?
- What would be the benefits or limitations of these approaches?

www.cancer.gov/types/unknown-primary/patient/unknown-primary-treatment-pdq

Scenario 2: Unknown cancer

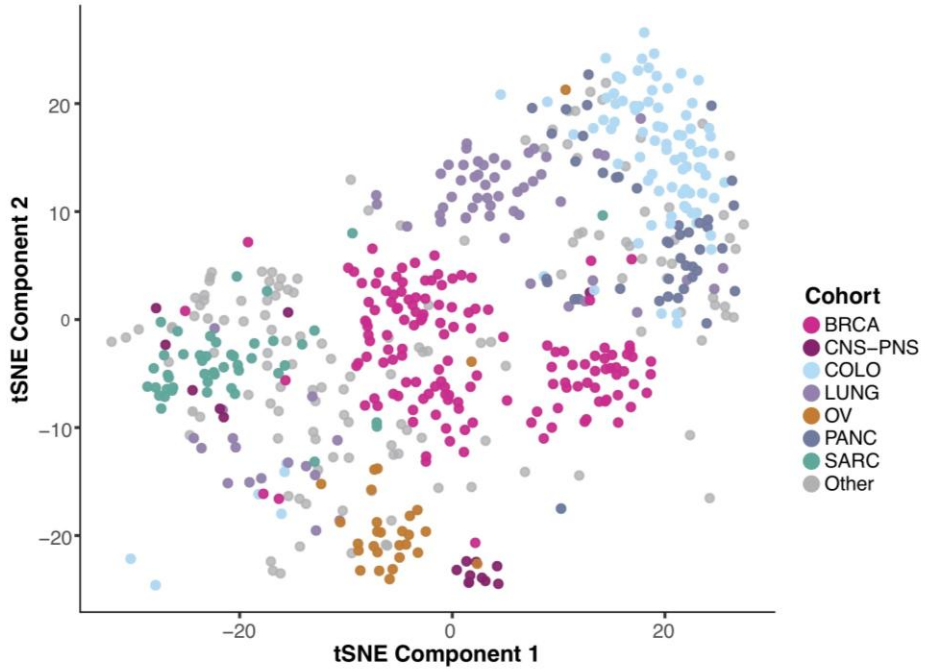

- Targeted vs. whole genome: Cost, complexity, comprehensiveness

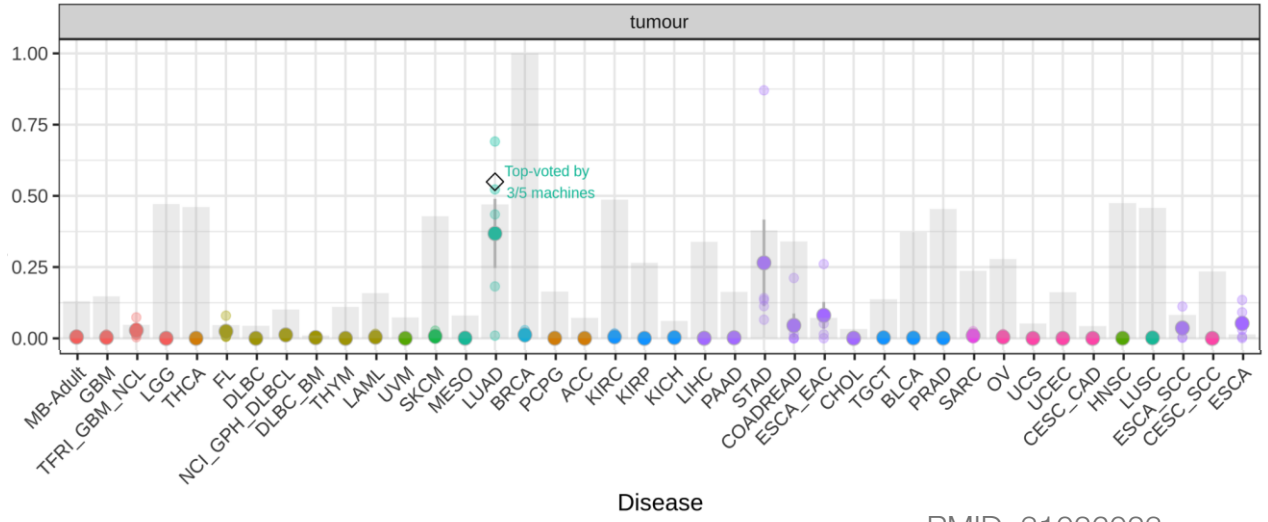

PMID: 41862707

Scenario 2: Unknown cancer

- RNA-Seq to aid with diagnosis

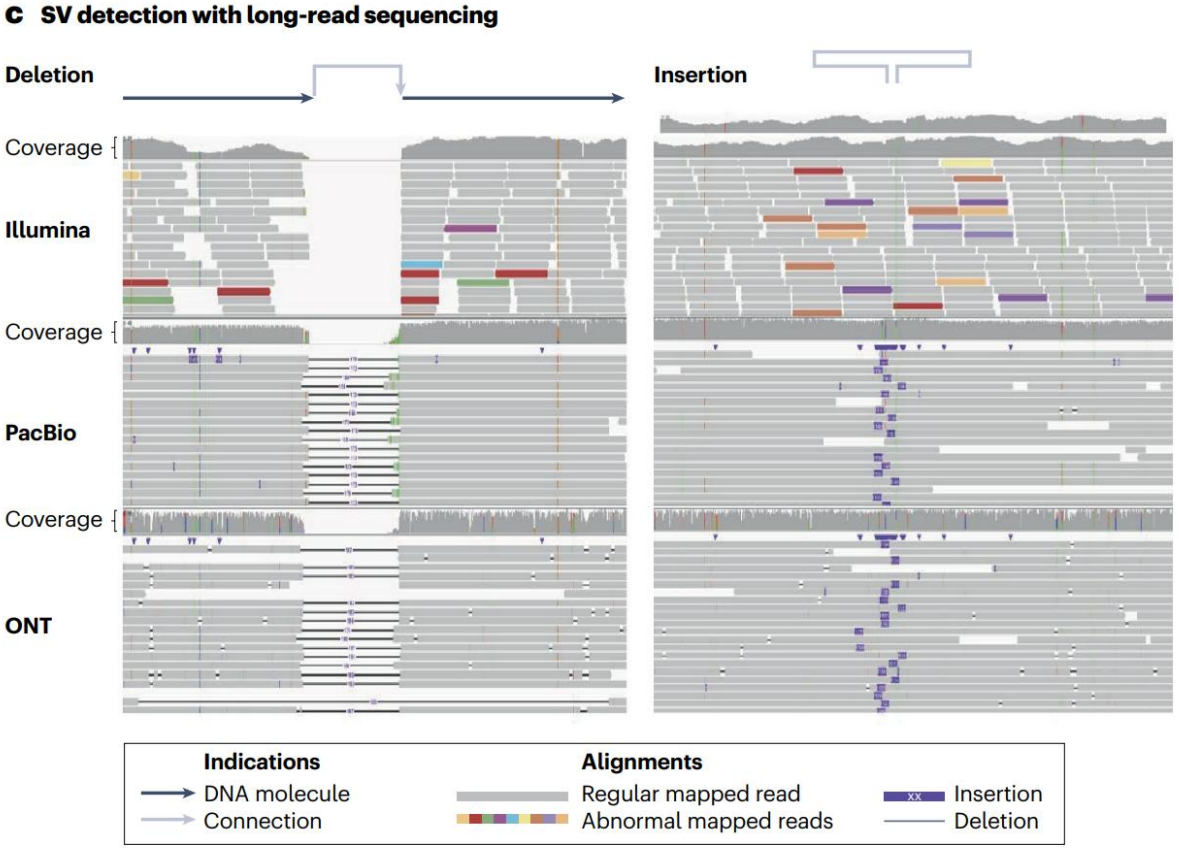

PMID: 35121966

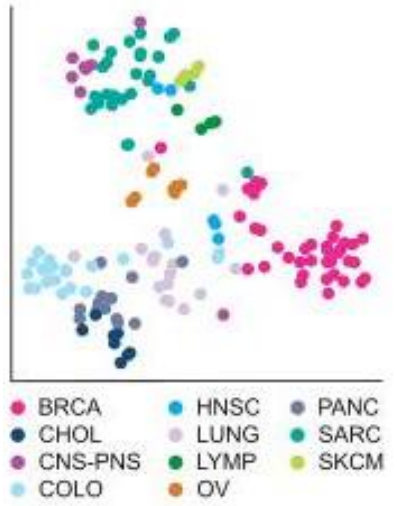

PMID: 31026023

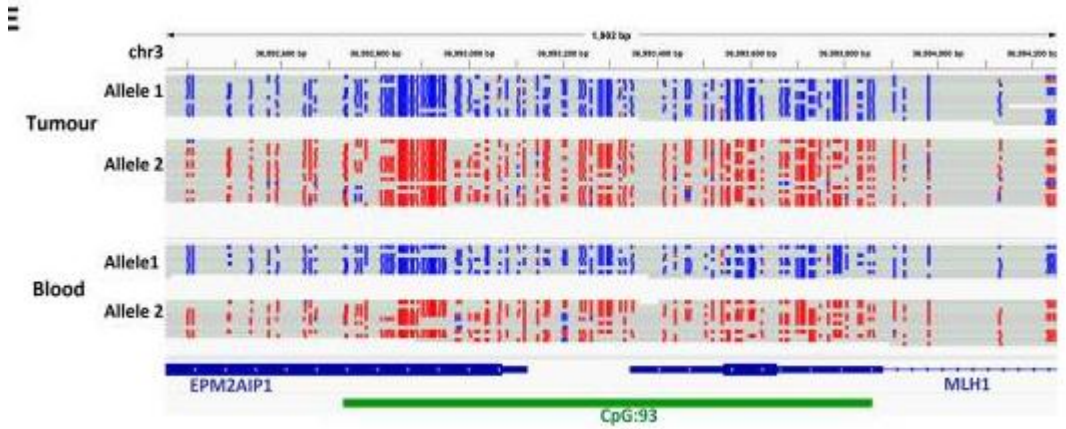

Scenario 2: Unknown cancer

- Long read vs short read: SV detection and methylation

PMID: 40817395

PMID: 39406235

Scenario 3: Novel species

- A rare new species has been discovered, the jackalope
- We have obtained tissue and blood samples
- We want to assemble a reference genome and understand what this species is related to

Harold Sanborn

Scenario 3: Novel species

- A rare new species has been discovered, the jackalope
- We have obtained tissue and blood samples
- We want to assemble a reference genome and understand what this species is related to

Discuss:

- What kind of sequencing approaches might be useful?
- What would be the benefits or limitations of these approaches?

Harold Sanborn

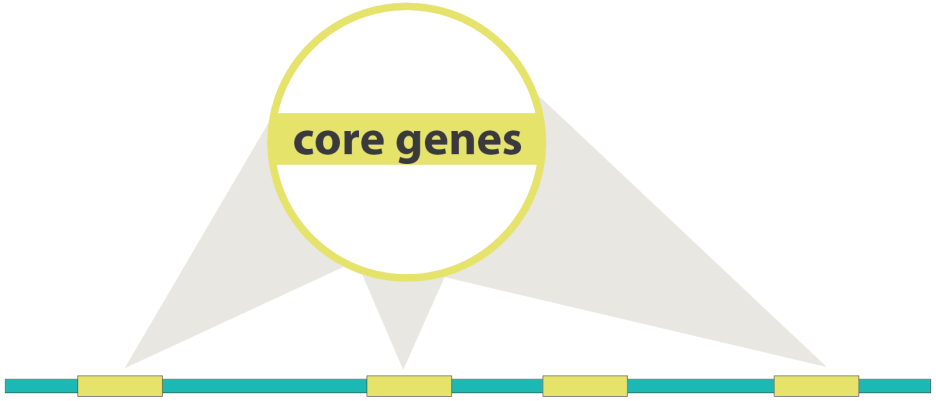

Scenario 3: Novel species

- Assembly quality

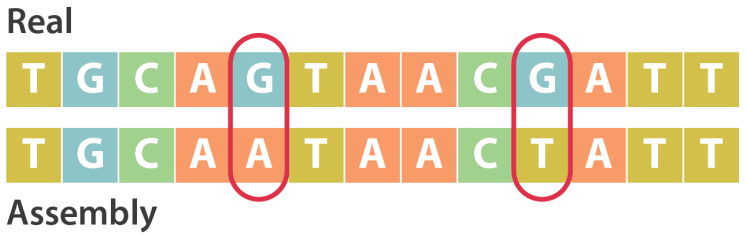

Contiguity

Completeness

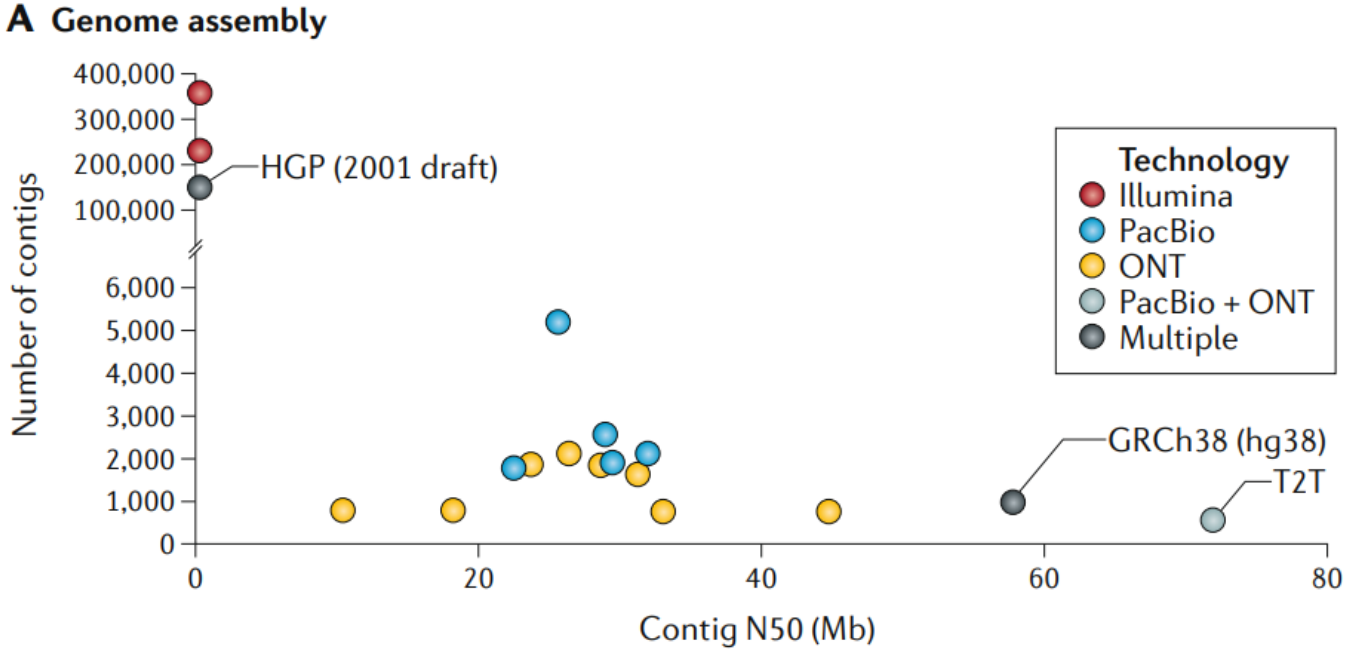

Correctness

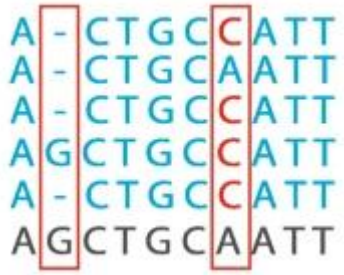

https://training.galaxyproject.org/training-material/topics/assembly/tutorials/assembly-quality-control/slides-plain.html

Scenario 3: Novel species

- Assembly quality: Long reads and short reads are complementary

PMID: 32504078

PMID: 34775997

Your own research

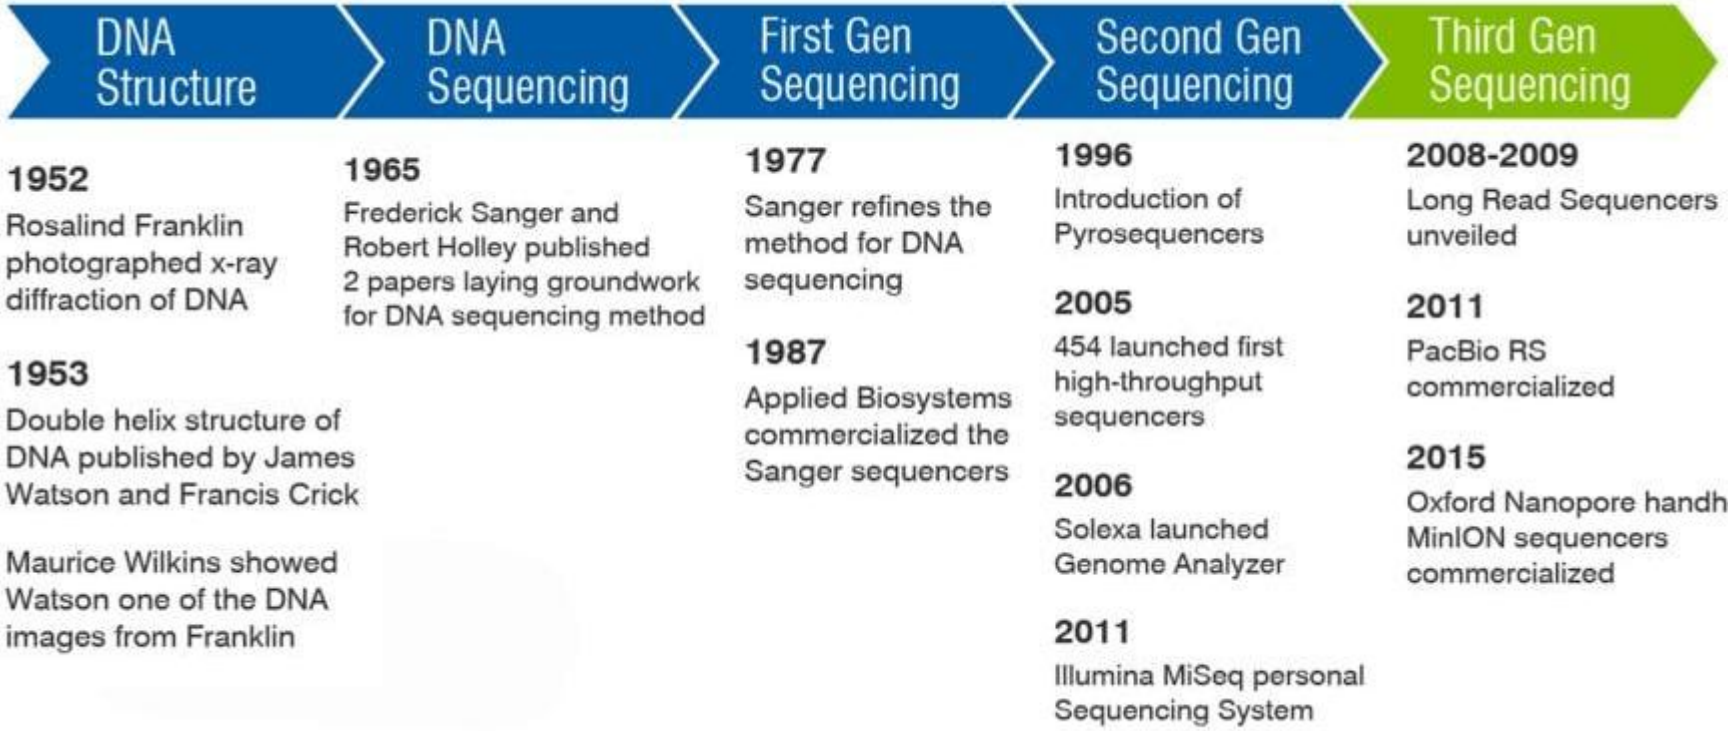

- What is a research question you have? Explain it briefly to your group.
- What technologies do you think might best apply to this question and why?
- What would be some of the limitations or challenges of using these technologies for your application?

Summary

Illumina sequencing	• Widely used with mature protocols and analysis tools • Highest throughput and lowest cost per base • Extremely accurate for SNVs and small indels • Ideal for WGS, RNA-Seq, single-cell seq, large cohorts	• Short reads, typically paired 150 bp • Structural variants, repeats, phasing can be challenging • Requires additional prep to detect epigenetic changes
PacBio SMRT sequencing	• Long reads, typically 10-25kb • Very high accuracy, with error rates less than 0.1% • Native methylation detection • Excellent for de novo assembly and structural variants	• High cost per base, making it the most expensive option for most applications • Lower throughput compared to other technologies • Requires high quality, molecular weight DNA
Oxford Nanopore	• Very long reads, 10K-100K+ bp • Direct detection of DNA & RNA epigenetic modifications • Portable and flexible, allowing for sequencing in remote locations or in real-time	• Somewhat higher cost and lower throughput than short read sequencing • Higher variability in accuracy compared to other technologies, particularly in homopolymers

DNA sequencing history

Newer technologies competing in short-read space:

2022
Element Biosciences (AVITI)

2023
Complete Genomics (Technology previously MGI)

2024
Ultima

2026
Roche SBS (Axelios)

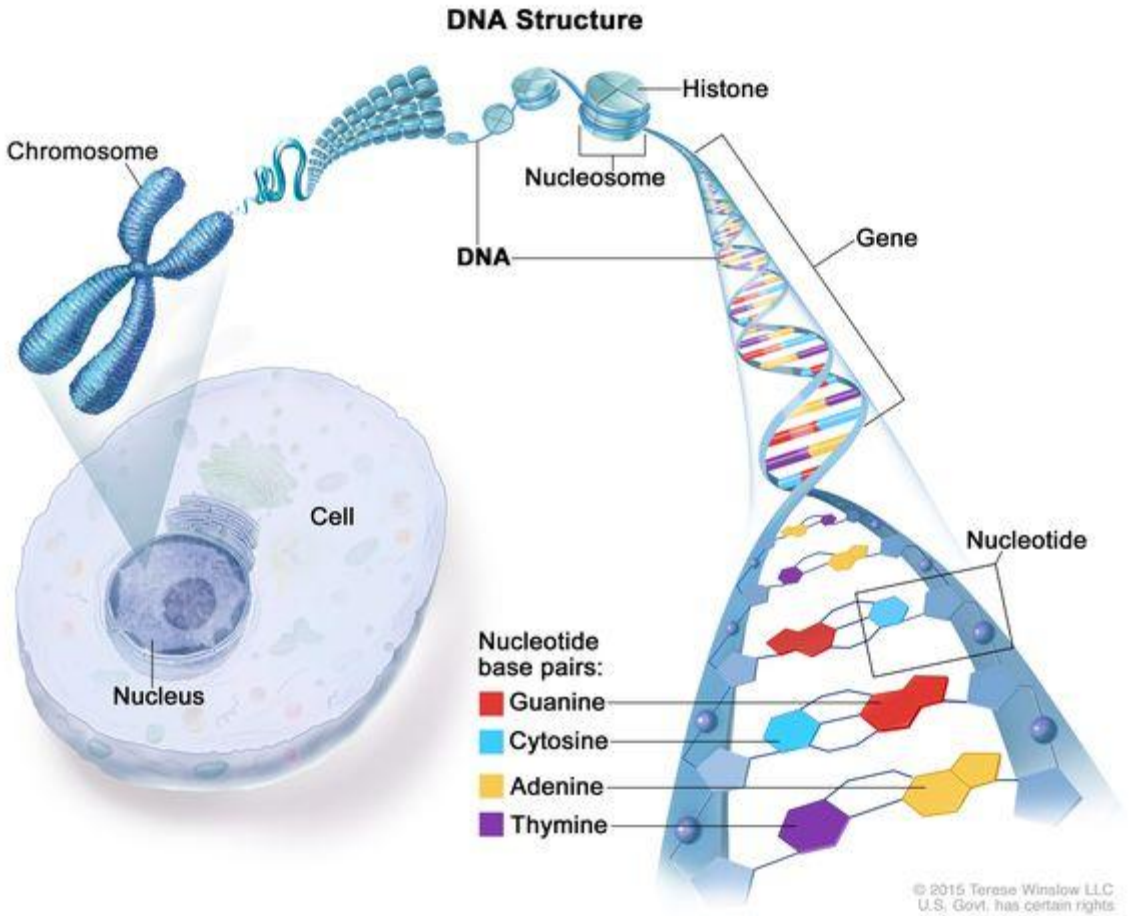

https://www.criver.com/eureka/history-dna-sequencing

Summary

- Technology is constantly changing
- Enables more science:

What can I ask now that I never could before?
